

MST Services Used

AI-Mediated Escrow Payment Gateway: every MST Blockchain service in our build, how we use it, who owns it, and the fallback.

Table of Contents

1. MST Testnet (EVM Layer 1, PoSA)	2
2. Smart Contract Layer: DealEscrow + MockUSD	2
3. MSTC Gas Token	2
4. MST RPC & WebSocket Endpoints	2
5. MST Block Explorer (mstscan / Blockscout)	3
6. Stablecoin: tMUSD / MockUSD	3
7. SARAL Protocol (MPC keyless onboarding)	3
8. WASMify (verifiable Web2 to chain execution)	3
9. BridgeKey (multi-chain wallet)	4
10. Post-Quantum Security Layer	4

At a glance

#	MST service	Priority	Owner	Used in
1	MST Testnet (EVM Layer 1, PoSA)	Core	B1	Every step of the deal lifecycle.
2	Smart Contract Layer: DealEscrow + MockUSD	Core	B1	Propose/accept deal, funding, delivery, release, dispute, resolution, arbitration.
3	MSTC Gas Token	Core	B1 + PG	Every on-chain transaction; user onboarding.
4	MST RPC & WebSocket Endpoints	Core	B1	Backend chain clients, indexer, frontend reads.
5	MST Block Explorer (mstscan / Blockscout)	Core	B1 + FE	Deal tracker, payment screen, rulings, pitch.
6	Stablecoin: tMUSD / MockUSD	Core	PG	Funding, settlement, refunds, dispute payouts.
7	SARAL Protocol (MPC keyless onboarding)	Should	PG + FE	Login, KYC, all user-signed actions.
8	WASMify (verifiable Web2 to chain execution)	Stretch	B2	Dispute resolution.
9	BridgeKey (multi-chain wallet)	Optional	FE + PG	Wallet connection, direct funding.
10	Post-Quantum Security Layer	Pitch only	Pitch	Pitch roadmap slide.

Priority: Core = must ship · Should = target by hour 8.5 · Stretch = only with SDK access by hour 7 · Optional = if quick · Pitch only = roadmap mention.

1. MST Testnet (EVM Layer 1, PoSA)

Priority	Core
Owner	B1
What it is	India's EVM-compatible Layer 1 blockchain using Proof of Staked Authority consensus. Chain ID 91562037, ~3-second blocks, low fees.
How we use it	Hosts our entire on-chain layer. Standard Solidity, Foundry, viem and MetaMask work unchanged, so we build with familiar Ethereum tooling.
Where in the flow	Every step of the deal lifecycle.
Fallback	None: must work by hour 1.

2. Smart Contract Layer: DealEscrow + MockUSD

Priority	Core
Owner	B1
What it is	Our contracts deployed on MST: DealEscrow (SOW-bound escrow and state machine) and MockUSD (6-decimal testnet stablecoin).
How we use it	Holds all escrowed funds, records both parties' commitment to the same SOW hash, enforces release, timeout, dispute, agent-proposal and arbitration rules. The AI agent can only propose; it cannot move funds.
Where in the flow	Propose/accept deal, funding, delivery, release, dispute, resolution, arbitration.
Fallback	None: core product.

3. MSTC Gas Token

Priority	Core
Owner	B1 + PG
What it is	MST's native token, used to pay transaction fees.
How we use it	Funds the ORG, agent and arbitrator wallets. A gas drip sends a small amount to each new user after KYC approval so they can sign their own transactions.
Where in the flow	Every on-chain transaction; user onboarding.
Fallback	Organizer-provided testnet MSTC.

4. MST RPC & WebSocket Endpoints

Priority	Core
Owner	B1
What it is	testnetrpc.mstblockchain.com over HTTP and WebSocket.
How we use it	HTTP for sending transactions and reading state (getDeal). WebSocket powers the backend event indexer, which updates the UI almost live thanks to ~3 s blocks.
Where in the flow	Backend chain clients, indexer, frontend reads.
Fallback	HTTP polling if WebSocket is unstable.

5. MST Block Explorer (mstscan / Blockscout)

Priority	Core
Owner	B1 + FE
What it is	Public explorer and contract verification service for MST.
How we use it	Contracts verified so anyone can read the source. Every timeline step in our UI links to its transaction: the live proof moment in the demo.
Where in the flow	Deal tracker, payment screen, rulings, pitch.
Fallback	Show raw transaction hashes.

6. Stablecoin: tMUSD / MockUSD

Priority	Core
Owner	PG
What it is	A dollar-pegged ERC-20 on MST. Masterstroke provides tMUSD (6 decimals); we ship MockUSD in the same format.
How we use it	The escrowed currency. The mock UPI on-ramp mints it after a confirmed fiat payment, then fundFor() locks it in escrow immediately. Swap to tMUSD if organizers grant minting access.
Where in the flow	Funding, settlement, refunds, dispute payouts.
Fallback	MockUSD (already built).

7. SARAL Protocol (MPC keyless onboarding)

Priority	Should
Owner	PG + FE
What it is	MST's SDK for logging into Web3 apps with a mobile number or Google/Facebook/Twitter, using multi-party computation instead of seed phrases.
How we use it	Device-authenticated login (the notebook's first step). The verified mobile number counts as KYC level 1. The SARAL signer is plugged into viem so users sign contract calls without a seed phrase.
Where in the flow	Login, KYC, all user-signed actions.
Fallback	MetaMask (decision at hour 8.5).

8. WASMify (verifiable Web2 to chain execution)

Priority	Stretch
Owner	B2
What it is	MST protocol that links conventional application logic to on-chain verification using zero-knowledge techniques.
How we use it	Runs our deterministic dispute-split formula (compiled to WASM) with a verifiable execution proof. The proof ID is committed inside the on-chain reasoningHash.
Where in the flow	Dispute resolution.
Fallback	Browser verify page runs the same WASM and checks the on-chain hash (decision at hour 7).

9. BridgeKey (multi-chain wallet)

Priority	Optional
Owner	FE + PG
What it is	MST's consumer multi-chain wallet with cross-chain transfers.
How we use it	Offered as a wallet option for users who already hold MST assets and want to fund a deal directly with fund().
Where in the flow	Wallet connection, direct funding.
Fallback	Skip if not integrated within 30 minutes.

10. Post-Quantum Security Layer

Priority	Pitch only
Owner	Pitch
What it is	MST's planned quantum-resistant cryptography layer.
How we use it	Roadmap point: long-lived escrow agreements and signatures that stay secure against future quantum attacks. Not integrated in the MVP, and we say so.
Where in the flow	Pitch roadmap slide.
Fallback	-

Network: MST testnet · chain ID 91562037 · RPC <https://testnetrpc.mstblockchain.com> · gas token MSTC. Full design: docs/MVP.md · Per-person plan: docs/TEAM_ROADMAP.md.
